

The database is the batch's memory

Core tables and the mechanisms that keep many writers from colliding

HOW CONCURRENT WRITES STAY SAFE

- WAL journal**
readers never block the one writer
- busy_timeout 30 s**
then up to 10 retries, jittered backoff
- Claim a company**
UPDATE ... WHERE pending: one winner
- Heartbeat**
renews the lease; silence lets it expire
- Crash recovery**
dead worker's items return to pending
- Save each year**
resume from the last completed fiscal year
- v014 unique index**
ended a double-save that duplicated rows
- Backups**
SQLite backup API; the last five kept

Also: file_cache, year checkpoints, custom prompts; 14 migrations.
